Problem Statement : Lack of practical, experiential financial learning among students

Brief about the idea: Our idea is a gamified financial learning application designed specifically for students to help them develop responsible money habits at an early stage.

The application simulates real-life financial situations where students manage virtual pocket money or stipends and make everyday decisions related to spending, saving, and digital payments.

Instead of learning through theory or quizzes, students learn by experiencing the consequences of their decisions in a safe and interactive environment. This approach helps build practical financial understanding, discipline, and confidence.

Opportunity should be able to explain the following:

- How different is it from any of the other existing ideas?

Most existing financial literacy solutions for students focus on theoretical learning through videos or quizzes. Our solution is different because it uses real-life simulations where students actively make financial decisions and experience their consequences, leading to behavioral learning rather than passive awareness.

- How will it be able to solve the problem?

The solution solves the problem by allowing students to practice budgeting, saving, and digital financial behavior in a safe virtual environment. By repeatedly making decisions and observing outcomes, students gradually develop better financial judgement, discipline, and confidence that can be applied in real life.

- USP of the proposed solution

A behavior-driven, gamified financial simulator that lets students learn finance by making real-life decisions and experiencing consequences, rather than memorizing concepts.

List of features offered by the solution

- Student-focused financial life simulation.
- Virtual pocket money or stipend management.
- Decision-based gameplay for spending and saving.
- Realistic financial events (impulse buys, emergencies, digital scams).
- Consequence-based feedback and monthly performance summary.
- Visual-first interface with voice guidance.
- Offline-capable and low-bandwidth friendly design.

Process flow diagram or Use-case diagram

The diagram shows how a student interacts with the system to learn financial decision-making through gameplay.

Wireframes/Mock diagrams of the proposed solution

Architecture diagram of the proposed solution

Technologies to be used in the solution:

Frontend: Android Mobile Application (Flutter)

Programming Language: Dart

Local Storage: SQLite / Shared Preferences (for offline gameplay)

Game Logic: Rule-based decision and simulation engine

AI Component: Behavior-based adaptive event selection

UI/UX: Visual-first interface with voice prompts

Deployment: Android APK

Estimated implementation cost (optional):

Add as per the requirements for the hackathon:

User track addressed: Students

Financial themes covered: -Budgeting

-Savings

-Digital finance and fraud prevention

Behavior Over Theory: -Learning through decision based simulations.

-Real life consequences through simulation instead of quizzes.

- Lightweight mobile application
- Offline-capable using local storage
- Visual-first interface with voice guidance
